Before Training (Baseline)

To determine the best candidate patch for filling the masked region of the original image, we need to consider the following aspects:
1. Visual Continuity: The patch should seamlessly blend with the existing elements in the image, maintaining the overall aesthetic and style.
2. Semantic Coherence: The patch should be semantically relevant to the scene, ensuring that it fits the context of the image.
Let's analyze each candidate patch:
- Patch 26: This patch appears to be a close-up of a wheel, which might not fit the context of the scene as it is not related to the horse-drawn carriage.
- Patch 25: This patch also seems to be a close-up of a wheel, similar to Patch 26, and might not provide a good fit.
- Patch 14: This patch shows a part of a horse, which could potentially fit

Answer: 14

After MPF Training

Prediction: The occluded area is part of the cart with wooden and metallic structure near the wheel. It includes wheel spokes, dark wooden texture, and shadows consistent with the cart's underframe.
Evaluate candidates:
Candidate 26: Shows a section of the cart wheel and its metallic structure, matching the occluded region's texture, geometry, and tonal contrast.
Candidate 25: Includes part of a wheel but the angle and contrast do not align with the occluded area.
Candidate 14: Displays the horse's head, irrelevant to the masked location.
Candidate 6: Depicts a building or background texture, not consistent with the cart.
Decision: Therefore, candidate 26 is the best match as it aligns with the
